

## Predicting Tweet Popularity through a Feature-based Approach

Group 12: Mojan Majid and Huayin Luo

## What type of tweets are receiving the most engagement?

- 1. Engagement with content
- 2. "Fake news", misinformation

## 1) Motivation

It is an interesting and important question to determine what type of tweets are receiving the most engagement and popularity, from multiple viewpoints

#### ORIGINAL PAPER

Predicting the popularity of tweets using internal and external knowledge: an empirical Bayes type approach

Wai Hong Tan<sup>1</sup> • Feng Chen<sup>2</sup>

Received: 16 November 2019 / Accepted: 8 February 2021 / Published online: 26 February 2021 © Springer-Verlag GmbH Germany, part of Springer Nature 2021

Predicting popularity of user content is a perplexing problem that captivates many.

Limited text length

280 char (\*as of Feb 2023, 4000 char for Twitter Blue users)

Popularity is complex & ambiguous

Most practical approaches take into account time-based data

### Reward Variables?\*

- 1. favourite count
- 2. retweet count
- 3. creation time
- 4. tweet text
- 5. user screen name
- 6. user status count
- 7. user followers count

### **Features**

#CDNPOLI, no retweets (avoid duplicate tweets)
Limitations: truncated text

## 2) Data Description

We used Cait's dataset that had 10,000 unique tweets. This data was extracted using the Twitter Developer API.

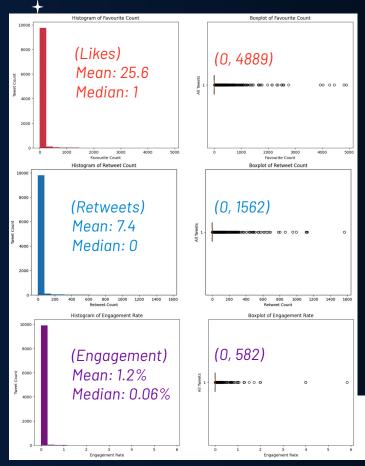

## Data Description - New Variables\*\*

We implemented some additional variables based on the existing variables:

Variable Name	Data Type	
Engagement Rate	Continuous (from 0 to 1)	100(# likes + # retweets) # followers
Engagement Score	Binary (1 if engagement rate >0.01, 0 otherwise)	
Low Engagement Score	Binary (1 if engagement rate >0.001, 0 otherwise)	
Time of Day Created	Categorical (Morning, Afternoon, Night, Evening)  Limitation: Created Time (UTC), we divide based on EST	
Sentiment Score	Continuous (from -1 to 1)	

Limitations:

- (1) Range of values
- (2) Distribution of values

3) EDA

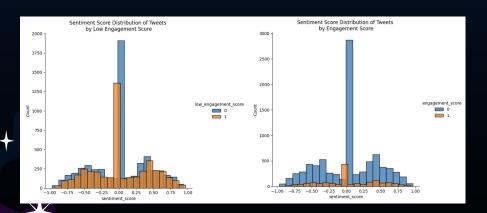

Some exploratory graphs & tables

100(# likes + # retweets) # followers

[Figure 1: Distribution of Favourite Count, Retweet Count, & Engagement Rate]

## User Follower Court Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Time Hour) Distribution of Timests by Engagement Scrip Theref Creation Timests by E

### Not Significant: Tweet Creation Time, by Engagement Scores

### significant: Sentiment Score, by Engagement Scores

### EDA - More Visualizations

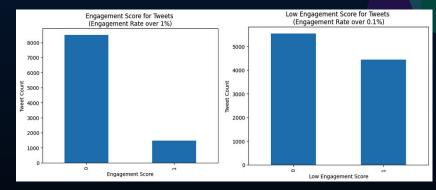

Figure 2: Engagement Score & Low Engagement Score Distribution

We looked at the difference in the distribution of variables, by engagement score, to identify potential features.

Jutcome

- 1. Sentiment Score for tweet [-1, 1]
- 2. Tweet Text Vectors (1000 words)

1. Username length

NLTK VADER
Pretrained Sentiment Model

Preprocessing + TF-IDF

4) Our Model

We used a two step approach, with Text Features for Non-Text Prediction

Logistic Regression

Binary: 0 or 1

Engagement Score
Low Engagement Score

Train Accuracy: 84.7%

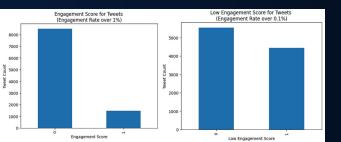

Test Accuracy: 85.7%

### **Low Engagement Score**

Train Accuracy: 67.4%

Test Accuracy: 67.0%

(Recall)

### 5) Results

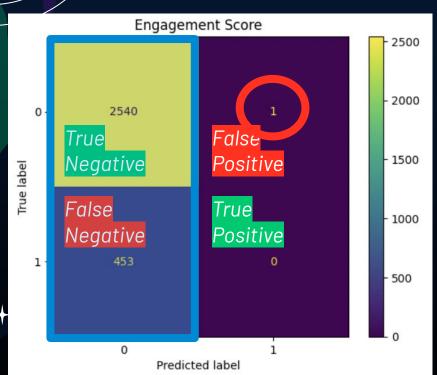

Engagement Score: model performs similarly to a "naive" model.

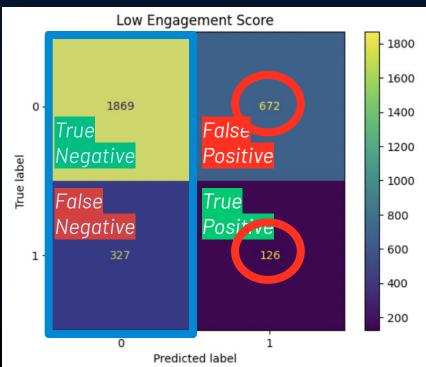

Low Engagement Score: performs better than both random & naive baseline models

Difference = Balanced dataset?

Naive" approach?

### Results - Conclusions & Next Steps

FNR: 0.15, FPR: 1.0

FNR:0.15, FPR: 0.84

Better! Try/ng.

## Results - Conclusions & Next Steps

Our model shows an interesting starting point for combining word features from NLP approaches with other informative variables in predicting popularity and engagement of a tweet. There are many ways in which we can improve:

- (1) Full tweet text (instead of truncated)
  - More insightful NLP vectors
- (2) More balanced dataset
  - balanced amount of popular/not popular tweets
  - more very popular/viral tweets
- (3) Other features...
